Pred. No. is the number of results predicted by chance to have

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AC003680 91854 bp Arabidopsis thaliana chromosome complete sequence. AC003680 AC003680.3 GI:20197048 N DNA BAC F17K2 linear 2 genomic sequence; PLN 11-MAR-2002

Arabidopsis thaliana (thale cress)
Arabidopsis thaliana
Butaryota; Viridiplantae; Streptophyta; Embryophyta, Tracheophyta,
Spermarophyta; Vagnoliophyta; eudicotyledons; core eudicots;
rosids; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Consideration programs including Genscan+ (Chris Burge, http://Cr.021.mit.edu/GENSCAN.html), GenemarkHMM (Mark Borodovsky, http://Genemark.biology.gatech.edu/GeneMark/), GilmmerA (a variant of GilmmerM, see Mihaela Pertea, http://www.igt.org/scAftlab/gilmmerm.html, and GensCall.www.igt.org/scAftlab/gilmmerm.html, and GensCall.cer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with thirdicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with BST similarity are named as unknown proteins. Genes without protein or EST similarity. Locations. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/ENAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://tp.genome.washington.edu/RM/Repeatmasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /codon_start=1

* NOTE: This is a "working draft' sequence. It currently
* consists of 77 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truns of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

MOTE: This is a 'working draft' sequence. It currently consists of 10 contides. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising:

(a) conteacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abloric stress: The present sequence is that of an Arabidopsis thaliana stress regulated gene (AB212196-AB217574) used in methods of the invention.

Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office. Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses Claim 144; SEQ ID NO 3729; 577pp + Sequence Listing; English.

                                       Novel shrunken seed gene useful for producing transgenic plants having altered production of food storage reserve material, intracellular transport of storage protein and formation of protein or oil bodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of Arabidopsis thaliana SSE1 (shrunken seed) cDNA, which was isolated from a seedling cDNA library using a partial genomic clone as probe. SSE1 encodes a protein (see AAB19718) that, when expressed in a cell of a plant, modifies or alters the production of a food storage reserve material (e.g. protein, libid or carbohydrate storage reserve), facilitates the intracellular transport of a storage protein, or facilitates the formation of protein or oil bodies. The invention provides a transgenic plant (or plant cell, plant tissue, plant organ or plant component) which includes a recombinant SSE1 ransgene that modifies the production of food storage reserves, thereby increasing nutritional value. An antisense construct is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 242.4; DB 21; Length 1483;

                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2000-679483/66.
```

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gens and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 cepresent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention on be used: for invention. Oligonucleotides from the present invention can be used: for disferentiating between healthy haematopoietic cells for differentiating between acute lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state-and/or-single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and or inferentiation can applitication of haematopoietic cell proliferation of disorder related captures, disorders related ampliferation of haematopoietic cell proliferation of haematopoietic cell proliferation of haematopoietic cell proliferative disorders. The present method enables chaptly specific classification of haematopoietic-cell proliferative disorders allowing for improved and informed treatment: of patients.

                                                                                                                                                                                                      (AAL07544-AAL26789) and methods of assessing whether a patient is affilted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and encoded polypeptides are also useful for isolating compounds with cytostatic polypeptides are also useful for isolating compounds with cytostatic

                                                                                                                                                                                The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
New isolated nucleic acid for diagnosing and treating cervical car
and for assessing and detecting compounds for treating the cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

New nucleic acid fragments from chemically treated angiogenesis-associated genes, useful for determining methylation status, e.g. in diagnosis or treatment of cancer

Claim 1; SEQ ID NO 154; 41pp + Sequence Listing; German.

bases of chemically pretreated DNA of angiogenesis-associated genes (II) having sequences (ABQ66971-ABQ67178) or their complements. (I), also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in anglogenesia-related genes, for diagnosis and treatment of eye diseases, proliferative retinopathy, neovascular glaucoma, solid tumours, inflammation, rheumatoid arthritis, diabetic retinopathy, macular degeneration caused by neovascularisation, psoriasis, arteriosclerosis, inflammatory bowel diseases, ulcers and crohn's disease. The invention relates to a nucleic acid (I) comprising a segment of 18

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopais thallana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying a stress condition; to which a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell has been exposed, comprising:

(a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses

Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' nontranslated sequence that functions in the cell to cause termination of translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker

The LMFD nucleic acid is used for determining a level or pattern of a molecule acid is used for determining a level or pattern of a molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 15112 bovine LMFD EST (expressed sequence tag) nucleic acids.
nucleic acid (comprising any of the 15112 nucleic acid sequences or its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1098 ATABABITABABGTABATCTTTTTGCCTAACCAATABABATTATTGABABTCTTTCCAA

The invention relates to a mucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer; in particular an oligomerical core of 346 sequences, and an oligomer that hybridises to or is identical or peptide mucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single mucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The mucleic acids are useful for diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, theoremsial disorders, particularly syndrome, cubercularly disorders, particularly syndrome, numerological disorders, procriasis, Rieger's syndrome, undemann-plot disorders, procriasis, congenital heart disease, HDR syndrome, arthritis, polyglucamine disorders, solid tumours concern. Sequences ABK28127 ABK28472 represent DNA transcription associated genomic DNA molecules of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA involution. The sequences are useful cycle-and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CDG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing oytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or proposis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, arthritis, glomerular disease, leavy body disease, arthritis,

New nucleic acid, oligonucleotides and peptide nucleic acid-oligomers, useful for detecting cytosine methylation state of genes associated with pharmacogenomics and for therapy of diseases e.g. cancer

Claim 1; SEQ ID No 58; 24pp; English

The invention relates to a nucleic acid comprising a sequence at least 18 bases in length of a segment of the chemically pretreated DNA of genes associated with pharmacogenomics according to one of the sequences of the genes ALDH6 (NM 000693), CYPIJA (NM 000781), CYPIJBI (NM 000497), CYP3A3 (NM 000756 and NM 017460), DPYD (NM 00110), EPHXZ (NM 001995), OCHN (NM 002380), TXNRD1 (NM 001330), UGTB (NM 01996), NM 019996, NM 019901, NM 019901, NM 019902, NM 019901, NM 019902, NM 019902, NM 019902, NM 019902, NM 019902, NM 019903, NM 019903, NM 019903, NM 019902, NM 019902, NM 019903, NM 019903, NM 019902, NM 019903, NM 01990 array for analysing diseases associated with the methylation state 33 and/or detecting SNPs (single nucleotide polymorphisms) the 87 sequences. The oligomers may also be used as PCR primers; set of 87 nucleic acids and their complements is useful for diagnosis; therapy of solid tumours and cancer. The present sequence as. (CpG) the

The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer in particular an oligomuclectide or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical transcription. The set of oligomer probes are useful for detecting the cranscription. The set of oligomer probes are useful for detecting the cranscription state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription of particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary Syndrome, haemacological disorders, immunological disorders, Wardenburg cuberculosis, developmental disorders, psoriasis, Rieger's syndrome, neurological disorders, methylation status disorders, myocardial infection, hypertension, anglogenesis, erpthropolesis, compension and sorders, solid tumours or cancer. Sequences ABK28127-ABX28472 represent DNA transcription associated genomic DNA molecules of the invention.

Subscribed and so this patent did not form part of the printed specification but was obtained in electronic format directly from the

Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides

Claim 28; SEQ ID 386; 117pp; English

differentiating between hematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contecting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagence. The method comprises contecting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. AB209861 to AB211118 or represent specifically claimed nucleotide sequences from the present invention. Oligonicleotides from the present invention can be used: for differentiating between healthy hadmantopoietic cells and proliferative disorder haematopoietic cells, for differentiating between acute invention state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related polymorphisms (SNPs) of haematopoietic cell proliferation disorder related nucleotide sequences and their complements; and as primers for the ample of the nucleotide sequences from the present invention can also be used for detecting a predisposition to/differentiation between subjectic cell proliferative disorders. The nucleotide sequences from the present invention can also be used for detecting a predisposition to/differentiation of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative a highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients. present invention describes a method for detecting and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid fragments from chemically treated angiogenesis-associated genes, useful for determining methylation status, e.g. in diagnosis or treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neovascular glaucoma, solid tumours, inflammation, rheumatoid arthritis, diabetic retinopathy, macular degeneration caused by neovascularisation psoriasis, arteriosclerosis, inflammatory bowel diseases, ulcers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a nucleic acid (I) comprising a segment of 18 bases of chemically pretreated DNA of angiogenesis-associated genes (having sequences (ABQ66971-ABQ67178) or their complements. (I), also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in angiogenesis-related genes, for diagnosis and treatment of eye diseases, proliferative retinopathy?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to a nucleic acid comprising a sequence of at least 18 bases of a segment of chemically pretreated DNA of genes associated with cell signalling. The activity of the modified sequences of the invention may be described as cytostatic. The object of the invention is to provide the chemically modified DNA of genes associated with cell signalling as well as oligonaclectides and/or PNA-oligoners for detecting cytosine methylations, as well as a method which is particularly suitable for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and therapy of diseases such as solid tumours and cancer. The sequences of genes associated with cell signalling.

The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office.

/Clone lib."Arabidopsis thaliana T-DNA insertion lines"
/note="PCR was performed on DNA from Arabidopsis thaliana
plants (TI) which were transformed with the T-DNA from
vector pAC16. The lines contain one or more T-DNA
insertions. The DNA fragment(s) resulting from the PCR
were directly sequenced to determine the genomic sequence
flanking the insertion. Sequences displaying significant
similarity to the A. thalaina nuclear genome sequence
processed for submission. T-DNA derived sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Arabidopsis thaliana (thale cress)

                                                                                    Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence is recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by clone f418. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             624

A large scale analysis of cDNA in Arabidopsis thaliana: Generation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AV521636 Arabidopsis thaliana aboveground organs two to six-week AU521636 Arabidopsis thaliana cDNA clone AP263b12F 3', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1540 ATATATATCCTGACGAGTCACATTTAGTAATCTCCCTTGGACGTGTAACGCCGTTAAAA 1599
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /clone=184K16185.39.30.x"
/clone=184K16185.39.30.x"
/clone=184K was performed on Arabidopsis thaliana lines each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cerrearrirricceecarcaaaaacerreaaracrarrereacarearriccrecres 120

An Arabidopsis full-length cDNA library was constructed essentially
as reported previously (Seki et al., 1998).cDNA cleaved with BamHI
and XhoI was ligated to modified.Lambda FLC-1 vector (Carninci et
al., submitted for publication) digested with BamHI and Sall. This
clone is in a modified pBluescript vector. Please visit our web
site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further

each of which contains one or more TDNA insertion
elements. The resultant fragment for each line was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is single pass sequence recovered from the left border of TDNA. This sequence lies within 300 bases of the 5' end of At2945680.
Class: TDNA tagged.
